

Auto Pump-Out

First Response: Being able to remove water as fast as possible is always an immediate concern when it comes to flood and water damaged sites. One needs to be able to reach surfaces exposed to air to start cleaning and drying them as soon as possible. With the Auto Pump-Out from PowerPlus you can remove a baseline amount of 1600 gallons per hour with an optional larger unit of 6000 gallons per hour for larger disasters. As you are able to more quickly respond to flooding, mud slides, chemical spills, and other situations, the better your results will be. Also the worry of continued exposure to contaminants will be much less.

Safe Water: The environment is important to everyone as is the need to keep contaminants out of our drinking water and soil. The Auto Pump-Out has built in filters that meet US city standards to regulate waste dumping. This means that clean water comes out of this system when you use it! This pump is fantastic in both small and large disasters.

How does the Auto Pump-Out work?

Team it up: The Auto Pump-Out is a great first line defense against contaminants getting back into water supplies and soil. It is the perfect counter part to our larger D.C.U. Filters, which can give you drinking water out of nuclear contaminated water. Pairing the two extends the longevity of your D.C.U. Filters as a pre-filter.

Explanation: The Auto Pump-Out connects in with your vacuum hose. The 1,600 - 6,000 gallon per hour pump pulls waste water through the stainless steel filter and pushes it out the filtered water output valve. The Auto-Pump disposes almost all waste water before it enters the waste tank, enabling you to work all day without stopping to drain your tank.
